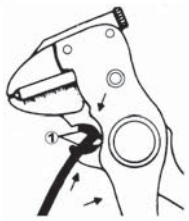
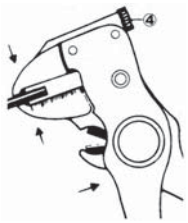
V1505	ADJUSTABLE WIRE STRIPPER & CUTTER



● Place cable between cutter blades (1) and close handle fully.

● Clamp prepared cable between front baldes(2) for the length to be stripped.



● Press handles; cable is locked by external jaws while the insulation is lightly cut without damage to the conductors. For cable with soft or very hard sheath, change blade pressure using the adjustment(4).

● The complete closing of the handles operates a sliding action of the blades that removes the insulation.

Because there is no set bolt to withstand the impact action, the bit always cuts and breaks the steel ball. So the Quick-Lock mechanismis out of order.

2. Our new Quick-Lock mechanism with the set bolt:

AN010258 DUAL MASS FLYWHEEL-SPECIAL TOOL (DMF)

- CONTENTS :

Many vehicle manufacturers choose to equip new models with a Dual Mass Flywheel and the trend is growing. The reasons for this are the technical benefits provided by the DMF as well as the need for increasing noise comfort while reducing emissions of state-of-the-art engines. The DMF characteristics are precisely attuned to each vehicle.
Always check the Dual Mass Flywheel (DMF) when replacing the clutch. A worn and defective DMF can damage the newly installed clutch!
A 100% functional test of the Dual Mass Flywheel includes among other things testing the characteristics of the Arc Springs during compression. This testing can only be carried out using a special test facility.
In addition, your assessment of the DMF's operational reliability should be based on the following criteria:
grease egress
condition of the friction surface (e.g. signs of thermal load / thermal cracks)
noise emissions
condition of the clutch, etc.
mileage
When uncertain, always replace the DMF along with the clutch.

WARNING !

1. Always stay cautious when using hand tools, and keep them away from children. Protective eyewear is recommended at all times.
2. Always unplug or disconnect the power source of any appliance or equipment before working on or near conductive surfaces as severe electrical shock may occur.
3. Select correct types and sizes of hand tool for the job purposes.

CAUTION:

Do not use hand sockets, universal joint or other manual tools with air tools.

It is improper to use hammer or pipe to increase the torque on wrenches, torque wrenches, and ratchet handles.

Do not use screwdrivers as pry bar, punch or chisel.

The Air Tools Operation Manual and Six Basic Maintenance Elements

1. Trough the tools' air inlet of air pressure, (not from the air pressure of air compressors the regular is 90PSI (6.2kg/cm²) which if it is too high or too low will damage the tools' function and lifetime. Air inlet must have enough lubricating oil (oil# 32 ~ #46). In order to help the motor inside the air tool to get the enough lubrication. (Place the blank paper outside the air exhaust to see, it is the normal if there is the greasy dirt which means there is enough oil.) The air inlet must not contain the water. It will not be appropriate if the compressor not dry through the compressed air dryer.
2. Do not disassemble the tools' parts for operation, it will damage the tools and also affect the safety for the operator.
3. Even the tools has small damage or not meet the original functions after using, it is not appropriate to continue use it which it has to be checked immediately.
4. Regular checking (approximately once a week), maintain the tools, add the grease to the rotating parts and add the lubricating oil (oil #32 ~ #46) to the motor of the air tools are all necessary to assure the performance.
5. Using the tools must follow the safety regulations and its operation manual.
6. t is important to choose the right and appropriate tools to operate since if the tool is high power will easy to cause the damage of workpiece and if the tool is low power will easy to cause the damage of tools.
